<p>While-loop description</p> <p>Difference from 'if'</p> <p>Breaking out</p> <p>Looping early</p>	<ol style="list-style-type: none"> 1. While loops: <ol style="list-style-type: none"> a. Are a method of flow control that loop over a block of code if (and only if) their conditional expression evaluates to True. <ol style="list-style-type: none"> i. Unlike 'if' statements, they repeatedly execute the attached block of code as long as their condition still evaluates to True; the condition is re-checked between each block execution. b. Can be exited from inside the attached code block by using the 'break' statement. c. Can be short-circuited from inside the code block back to the top of the loop (the conditional check) by using the 'continue' statement.

Summary/Reflection:
